

CLoud DISASTER RECOVERY

WHAT IS IT

Cloud Backup is designed for organisations requiring a simple, secure and reliable data backup, which would be held offsite. An automatic and fully monitored backup of your business data is securely completed. In the event of issues, your data would be available to retrieve from our highly secure, hosted location.

HOW DOES IT WORK

A secure upload of your files (word documents, excel spreadsheets, PDFs, images etc.) and folders is completed at set intervals agreed with you, to our offsite storage location.

Following the first full backup, future backups are performed incrementally, meaning that only items that have changed will be updated, so saving you precious bandwidth.

The security of your data is assured as it is uploaded using an encrypted SSL connection and it remains encrypted whilst on our cloud servers.

If you need to recover any items then these are available to restore directly.

WHY DO YOU NEED IT

Most businesses have experienced data loss of some kind and, in a lot of cases, this can be frustrating, rather than causing any major issues. However, there are times when the loss of data can have a near catastrophic impact on a business and make it almost impossible to return to normal. It is therefore essential that you do everything you can to help safeguard your valuable business data.

**BY IMPLEMENTING INTEGRATECH'S CLOUD BACKUP SOLUTION,
YOU CAN SAVE YOUR BUSINESS PRECIOUS TIME AND MONEY,
AND POSSIBLY EVEN THE BUSINESS ITSELF.**

WHY YOU NEED DISASTER RECOVERY

When we think of disaster recovery, we often think of catastrophic disasters like fires or floods. However, although those sorts of disasters do happen, the reality is that the majority of unplanned downtime and data loss is caused by power outages, hardware failure, human error or viruses and malware.

Consider what the impact would be on your ability to do your day-to-day business if you were unfortunate enough to suffer a disaster?

With so many potential pitfalls, it is essential that you take adequate measures to safeguard your data should the worst happen.

Disaster recovery planning may not be a glamorous task, but in today's IT intensive business climate, it is a necessary part of a successful business strategy.

ENSURE YOU TEST IT

Once you have a disaster recovery plan in place, it is vitally important that you test it so that you and your employees know what to expect should you ever have to use it in a real-life situation. Regular testing will uncover invaluable information which you can use to fine-tune your plan. Including indications of how long it will typically take to retrieve files and folders in the event of a disaster.

NEXT STEPS

We can provide you with help through all of the stages, from initial planning, solution selection and implementation, right through to periodic testing and process refinement.

Talk to us about your business and to understand more about the full range of disaster recovery services we have to offer.

Cloud Backup

VEEAM | PROPARTNER
Silver Reseller

DATA CENTRE INFO

- Steel reinforced blast proof walls
- Military electro magnetic pulse protection
- Solid steel doors
- 'Tempest' RFI intrusion protection
- CCTV
- Sophisticated access controls
- Redundant air conditioning units to guarantee stable temperature and humidity @ N+1
- Redundant UPS conditioned power @ N+1
- Diverse Power Supplies with diesel generator back-up @ N+1
- Carrier Neutral Facility
- Multiple Fibre Providers
- Multiple Internet Service Providers
- Diverse independent telco risers from public highway to data floor
- Two separate incoming power supplies with dual diesel generator backup
- Firetrace fire suppression system
